

Date: 28 July 2026 · Companion to ui-audit-findings.md (findings F-031, F-032) **Scope:** all 66 recipes owned by JordanE. Analysed on the isolated ui-audit Neon branch; **nothing has been changed** — this is a proposal.

> **v2 changes** after review: baked kept as a cooking method (and stovetop with it, so the facet > doesn't lie by omission); a **Protein** facet added, absorbing vegetables as veggie; the > **Dish type** facet dropped entirely, which removes soup and shelves the proposed appetizer; > **Diet / workflow** renamed **Additional tags**.

Current state

21 distinct tags, 1.76 per recipe. main (47) and side (17) cover almost everything, then it collapses — **9 tags are used on exactly one recipe**.

1. **Four duplicate pairs** render as separate chips: crock pot (13) / crock-pot (2) · mexican (2) / Mexican (1) · italian (5) / Italian-American (1) · Greek as the lone capitalised cuisine.
 2. **Under-tagging is the bigger problem.** 34 of 66 carry only a course tag, and some are wrong by omission — "Air Fryer Mozzarella Sticks" and "Chicken (air fried)" have no air-fryer tag, so filtering by it hides 2 of the 8.
 3. **Six unrelated facets share one flat namespace**, so keto sits beside main beside chicken in a single undifferentiated chip row.
-

Vocabulary — 24 tags across 4 facets

Course — required, exactly one

main · side

Structural, not descriptive. `recipeSegment()` returns main | side | other and every consumer collapses it to a binary (`kind === "side" ? "side" : "main"`) — planner card colours, sort order, cook history, shopping-list grouping. Adding values here means extending the type and seven call sites, which is why soup and appetizer are **not** course values.

Protein — optional, at most one

chicken (24) · beef (15) · veggie (21) · turkey (2) · pork (2) · seafood (1)

Answers "what am I in the mood for". veggie means no meat, and replaces the old vegetables tag.

Method — optional, at most one

crock-pot · air-fryer · grill · baked · stovetop

Kept baked, and stovetop alongside it — with baked present, an untagged stovetop recipe would silently vanish from a method filter.

Every method below is derived from the recipe's own instruction text, not guessed from its title. 15 recipes name two methods (a crock pot plus a browning step, an air fryer plus boiling pasta), so the rule is: **tag the distinguishing appliance** — the one that changes how you plan your day. crock-pot > grill > air-fryer > baked > stovetop, with stovetop only when nothing else applies. Three recipes involve no cooking at all and correctly have no method.

Cuisine — optional, at most one

italian · mexican · asian · indian · japanese · greek · southern · middle-eastern · lithuanian

The most natural browse axis and the most under-used today — 12 recipes have one; 36 would.

Additional tags — optional, any number

keto · meal-prep

The catch-all for anything that isn't course, protein, method or cuisine. freezer folds into meal-prep (both sat on the same single recipe).

Dropped

Tag	Why
chicken (as a bare tag)	Superseded by the Protein facet
vegetables	Superseded by veggie
soup	Dish-type facet removed; both soup titles contain "Soup", so search already finds them
freezer	Merged into meal-prep
crock-pot, Mexican, Italian-American, Greek	Merged into canonical spellings

Naming rule: lowercase, hyphen-separated, singular. `crock pot` → `crock-pot`, matching the existing `air-fryer` and `meal-prep`.

On the count: 21 → 24, which is *more* tags, not fewer. That is deliberate. The original complaint was never the number; it was 21 undifferentiated chips mixing six concepts, a third of them used once. Grouped into four labelled facets where each value earns its place, 24 reads as far less than 21 did. If it still feels heavy once grouped, the cheapest trims are the four single-recipe cuisines and stovetop.

Per-recipe values

All values are derived from the recipe's own ingredients and instruction text. The ten open questions from v2 are now resolved — see *How the last ten were settled* below.

Recipe	Course	Protein	Method	Cuisine	Additional
Air fryer asparagus	side	veggie	air-fryer	—	—
Air fryer broccoli	side	veggie	air-fryer	—	—
Air fryer Brussels sprouts	side	veggie	air-fryer	—	—
Air fryer potatoes	side	veggie	air-fryer	—	—
Air fryer squash	side	veggie	air-fryer	—	—

Recipe	Course	Protein	Method	Cuisine	Additional
Air fryer zucchini chips	side	veggie	air-fryer	—	—
Air Fryer Mozzarella Sticks	side	veggie	air-fryer	—	—
Barbacoa	main	beef	crock-pot	mexican	—

Tzatziki	side	veggie	—	greek	—
Šaltibaršniai	main	veggie	stovetop	lithuanian	—
~~Test recipe2~~	—	—	—	—	delete, don't tag

How the last ten were settled

Reading the full instruction text rather than pattern-matching resolved every open question:

Recipe	Was	Now	Evidence
Chicken pita pockets	no method	stovetop, greek	"Pan fry chicken for 4-6 minutes" — it does cook; "pan fry" was missed by the earlier regex. Pita, hummus and Greek vinaigrette settle the cuisine.

Recipe	Was	Now	Evidence
Soy glazed meatloaf	stovetop, asian	baked, no cuisine	"Cook for 25 min at 450", "Roast meatloaf". The glaze is soy-based but the dish is an American meatloaf — a soy glaze doesn't make it Asian.
Lemon spaghetti	air-fryer	stovetop, veggie	The air fryer only does the zucchini garnish — "combine with any main going into air fryer". The dish is boiled pasta with a sautéed sauce. Its "chicken" was stock concentrate.
Garlic bread	unresolved	baked	Only "cook for 5 min", no appliance named — but bread with butter and parmesan for 5 minutes is an oven. Lowest-confidence call here.
Grilled carne asada	beef ■	beef	Ingredient is named "Carne asada", so nothing matched "beef".
Quesadilla (with leftovers)	veggie ■	no protein	Ingredient is literally "Leftover meat / filling". Empty is the honest answer.
Curry peanut chicken	asian ■	asian	Yellow curry paste and peanut butter (Thai) with mirin (Japanese) — a fusion, so the general bucket is right.
Meatballs (Keto)	italian ■	italian	Tomato sauce, parmesan, mozzarella, oregano.

Lemon italian chicken w/ spaghetti stays air-fryer — unlike Lemon spaghetti, its chicken really is air-fried ("Air fry chicken for 13 min").

One data issue surfaced along the way: **Lemon spaghetti and Lemon italian chicken share near-identical instruction text**, which looks like a copy-paste artifact rather than a tagging problem.

Resulting distribution

Facet	Values	Coverage
Course	main (47), side (18)	65/65
Protein	chicken (24), veggie (21), beef (15), turkey (2), pork (2), seafood (1)	65

Facet	Values	Coverage
Method	crock-pot (17), stovetop (18), air-fryer (13), baked (9), grill (6)	63 — 2 no-cook
Cuisine	italian (16), mexican (8), asian (4), indian (2), japanese (2), greek (2), southern (1), middle-eastern (1), lithuanian (1)	37 — up from 12
Additional	keto (2), meal-prep (1)	3

Sequencing — order matters

Cleaning the data first would be undone by the next import, because `api/recipes/parse.js` types tags as an unconstrained `z.array(z.string())`.

1. **Constrain the parser** to this vocabulary (a `z.enum` per facet) so imports can't mint Italian-American again.
2. **Add a normaliser** on write *and* read — lowercase, trim, hyphenate — so stray input collapses onto a canonical tag.
3. **Group chips by facet in the UI.** `uniqueTags()` emits one flat row today; labelled groups are what actually fixes "too many tags".
4. **Add tag editing** (F-031) — there is currently no way to add, rename, remove or merge a tag anywhere in the app, which is why these duplicates can't be fixed by hand.
5. **Then migrate the data** from the table above.

Steps 1–4 are code and safe to do now. Step 5 is an UPDATE against **production** — the `ui-audit` branch is a throwaway copy, so the migration has to target the live database. Same shape as the servings backfill: verify on the branch, snapshot `main` as a rollback point, then apply.
